It is very important to detect as fast as error detection when there is a problem in the broadcast.

Easy Monitoring is helpful at the point of error detection and reporting about whether the error is in the satellite capacity provider, in the uplink section, or in the studio section.

The Easy Monitoring system solves this problem. Output variety thanks to, the points needed in the broadcast stream can be monitored. The satellite provider allows you to monitor MPTS packets with DVB / S-S2 transponder inputs so that it can be included in the monitoring. Encoder outputs with ASI / IP inputs or IP and ASI resources can be monitored.

HD/SD SDI and HDMI inputs are also analyzed with image and audio preview.

Source, PID losses, frost and sloughing in view, silence and high volume values can be detected and can be tracked. Error reporting, audible alarm at the time of error and informing the related pesons via mail can be done automatically and display modes on the output screen can be customized.

With the round robin feature, you can stay on screen for as long as you want and provide a professional transition between resources. If requested, the resources selected as options can be recorded.
